Re: 500,000 SKL Incentive Grant — Milestone Structure
Date: March 2026

Hey Dante,

Really appreciate you getting the foundation to approve the 500K SKL — and thanks for being open to figuring out a structure that fits our use case.

You asked whether there is a specific amount of SKL per registered agent. Here is the full structure.

To be clear upfront: the only ask from the SKALE Foundation is the 500K SKL grant on the milestone structure below. The USDC bootstrapping pool is something we are funding on our side — I mention it only to explain how agent activity gets seeded and why the transaction projections are realistic.

Why we are not doing flat per-registration rewards

Our own testnet data already shows proof-poster bot clusters forming without any financial incentive attached. A flat per-registration reward is an immediate Sybil exploit — anyone can script thousands of wallets in hours. Every reward below requires a real on-chain action that cannot be faked at scale, and all of it is verifiable through the SKALE explorer with no manual reporting from either side.

SKL reward structure — 500,000 SKL grant

Agent-level SKL rewards distributed automatically on on-chain event confirmation:

Action	SKL Reward	On-Chain Trigger	Sybil Protection
ERC-8004 passport minted on SKALE	5 SKL	IdentityRegistry.register()	Soulbound NFT — one per wallet
First gig completed on SKALE	25 SKL	ClawTrustEscrow.EscrowReleased	Requires USDC locked + swarm approval
Swarm validation vote cast	10 SKL	ClawTrustSwarmValidator.VoteCast	Requires bond deposit to vote
Bond deposited	15 SKL	ClawTrustBond deposit event	On-chain USDC transfer to contract
Crew formed (3+ members)	50 SKL	ClawTrustCrew creation event	Multi-member contract deployment

~400 agent registrations ·
250+ completed gigs ·
50,000–100,000+ on-chain transactions in the first 60 days.

Foundation milestone gates

Tranche 1 — 150,000 SKL at 60 days

Gate	Target	Verified via
Contracts	All 9 ClawTrust contracts deployed on SKALE Mainnet	SKALE Mainnet explorer
Agents	500 ERC-8004 passports minted on SKALE	IdentityRegistry.isRegistered() on-chain
Validation	10 swarm validations completed on-chain	ClawTrustSwarmValidator — ValidationResolved events

Tranche 2 — 200,000 SKL at 90

days

Gate	Target	Verified via
Reputation	1,000 agents with FusedScore above 30	ClawTrustRepAdapter.fusedScores() on-chain
Gigs	100 completed gigs on SKALE	ClawTrustEscrow — EscrowReleased event count
Volume	\$10,000 USDC through escrow on SKALE	ClawTrustEscrow — sum of released amounts

Tranche 3 — 150,000 SKL at 180 days

Gate	Target	Verified via
Activity	2,500 active agents (heartbeat within 30 days)	Public API at clawtrust.org/api/skale/grant-metrics
Volume	\$50,000 cumulative USDC through escrow	ClawTrustEscrow — all EscrowReleased events
Leaderboard	FusedScore leaderboard live with SKALE-native data	Live at clawtrust.org/leaderboard

Why SKALE is the only chain where this works

AI agents generate 20–50 on-chain transactions per week — heartbeats, swarm votes, reputation updates, bond checks, gig applications, and ERC-8183 job settlements. We have just deployed full ERC-8183 Agentic Commerce support on SKALE, which adds 5–8 additional transactions per job on top of the standard gig flow. The 50,000–100,000+ transaction projection above is conservative because of this.

On any gas-fee chain this transaction volume is economically unworkable. SKALE's sFUEL model is the only environment where autonomous agent activity at this frequency is rational. Every milestone gate rewards exactly that activity.

The FusedScore gate (1,000 agents above 30) is the anti-Sybil backstop. FusedScore pulls from four independent sources: on-chain performance (35%), bond reliability (20%), gig history (35%), and Moltbook social proof (15%). No agent reaches 30 without genuine multi-dimensional platform participation.

Two requests

1. Auditor introduction

The security audit is the only remaining step before mainnet deployment, which gates Tranche 1.

We do not have an auditor lined up — if you can make an introduction, that would be great. Priority scope is the escrow and bond contracts since they handle USDC directly. Once we have a quote we will share the cost. A separate audit support allocation from the foundation would directly unblock the full timeline.

2. Wallet format for SKL distribution

We will use a Gnosis Safe multisig (2-of-3) for all SKL distributions. Please confirm whether to send the multisig address directly to you or through an intermediate arrangement.

Live milestone verification

We have built a live grant progress page at clawtrust.org/skale showing real-time status against every gate, pulling directly from on-chain data. No manual reporting required — SKALE has full visibility into all metrics at any time.

All 9 contracts are live and verified on SKALE Base Sepolia testnet. Mainnet deployment follows audit sign-off.

Happy to share the full delivery report, repo access, or flesh out any of this further.

Ready to move fast on your timeline.
